More on Abstraction in Java

Recap of abstract classes and methods

Abstract vs Concrete

- Abstract
  - Implementation delayed
    - $\rightarrow$ abstract method has no code
    - $\rightarrow$ cannot instantiate an abstract class (it has, by definition "unfinished" methods)

- Concrete
  - Ready to go.
  - Everything up to now has been concrete.

Inheritance hierarchies
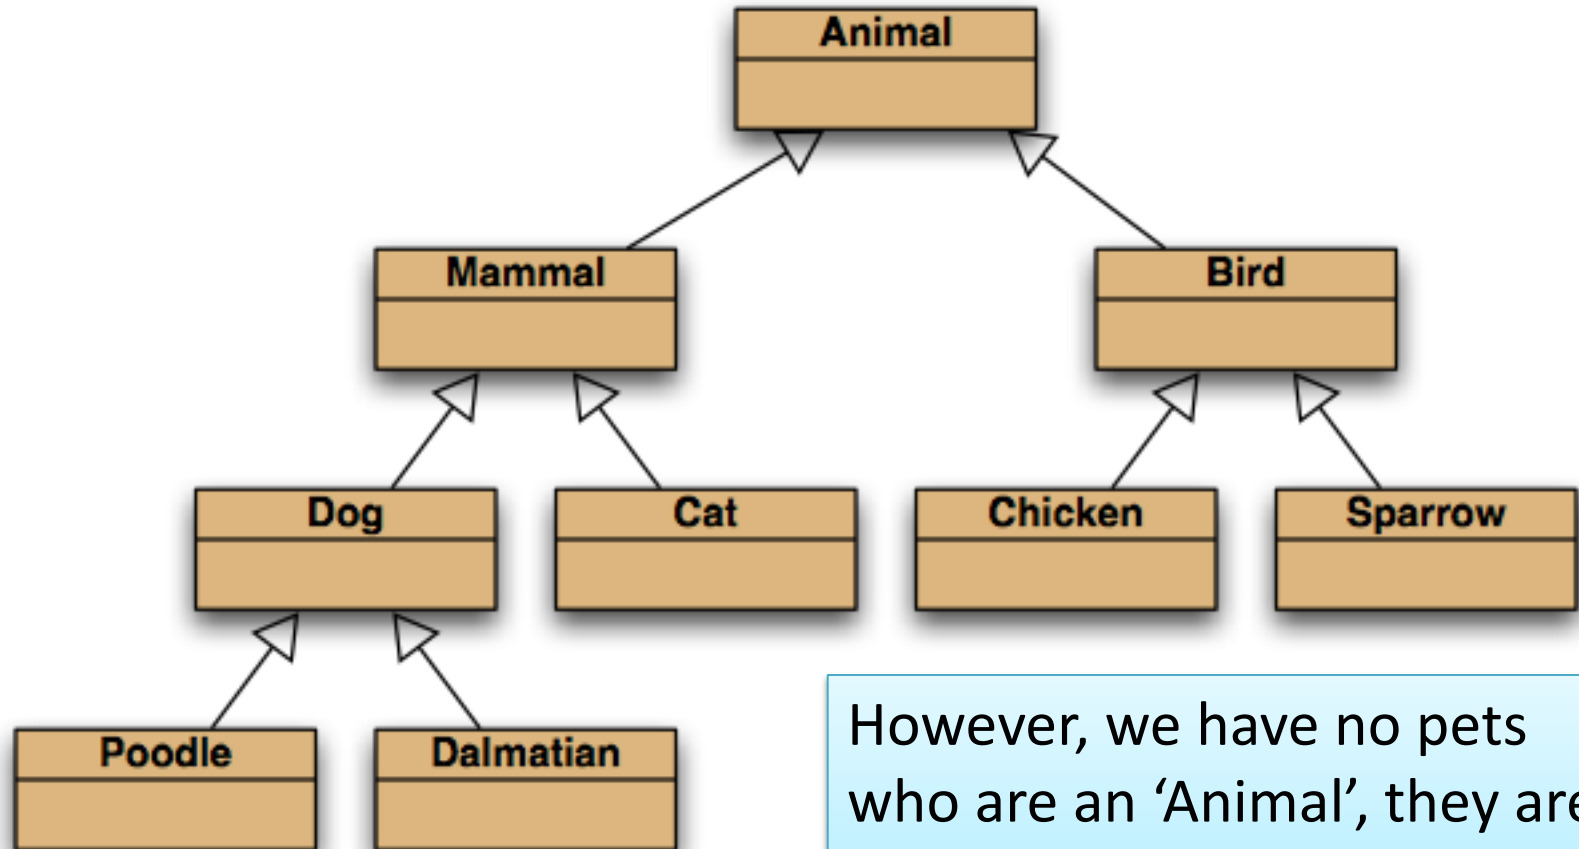

However, we have no pets who are an 'Animal', they are either a Dog, a Cat, a Chicken, etc.

Abstract Methods

- Abstract methods have `abstract` in the signature.

- Abstract methods have no body.
  - 'We promise to write this later. Every (concrete) subclass of this class will have this implemented in the subclass.'

- Abstract methods make the class abstract.
  - Think about why this is?
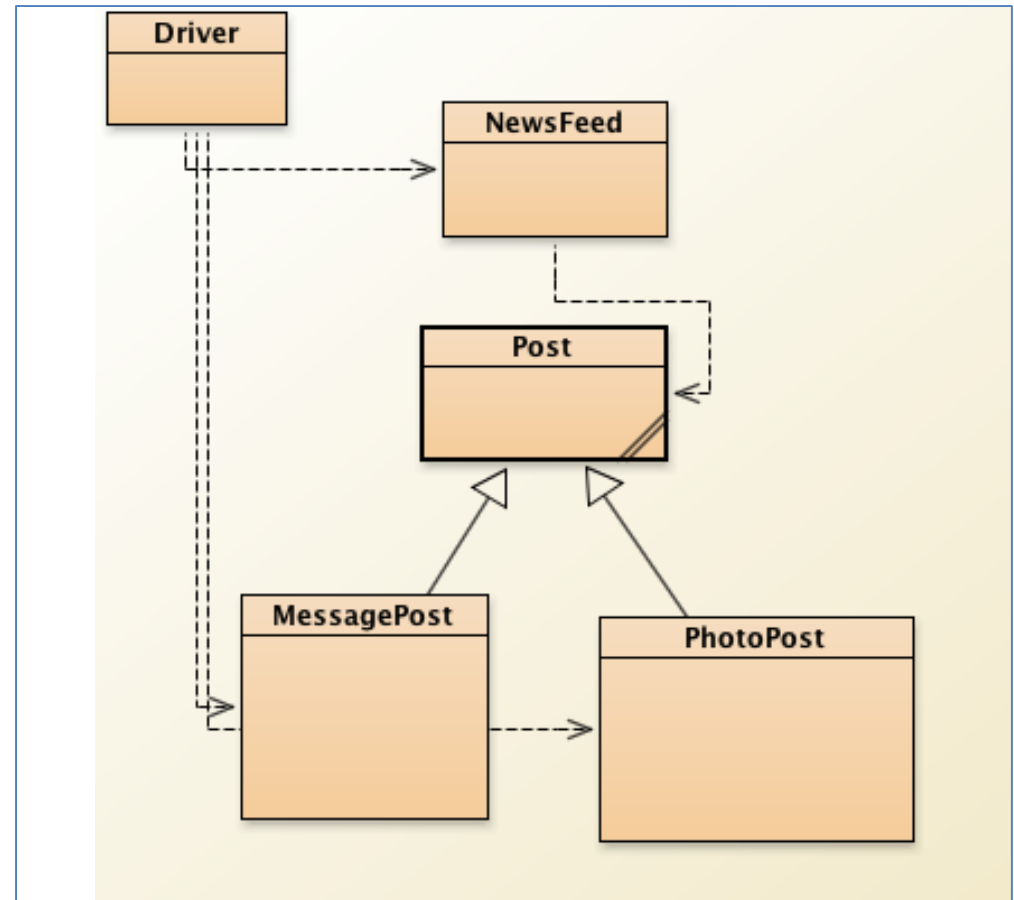

Abstract Classes

- An abstract class is a class that contains <u>zero or more</u> abstract methods.

- An class that has an abstract method <u>must</u> be declared abstract.

- Abstract classes cannot be instantiated.

- Abstract classes function as a "base" for subclasses.

  → abstract classes can be subclassed.

- Concrete subclasses complete the implementation.

Network-V4 (no abstraction)

```
Options

Posts
1) Add a Text Post
2) Add a Photo Post
3) List all Posts
0) Exit
==>>
```
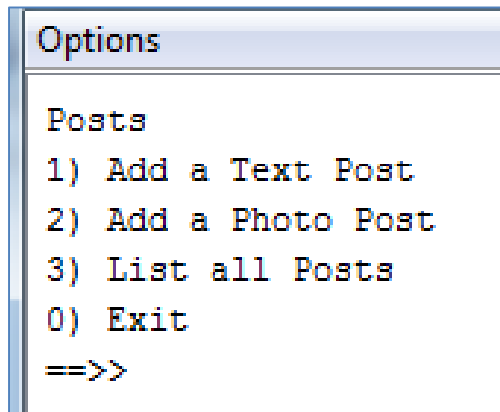

Our news feed displays either MessagePost or PhotoPost objects.

NOTE: we never create a Post object but our ArrayList is of Post.

Network-V5 (Post as an abstract class)

```
Options

Posts
1) Add a Text Post
2) Add a Photo Post
3) List all Posts
0) Exit
==>>
```

So, because we never create a Post object but our ArrayList is of Post…

We can make Post abstract!

Network-V5 (Post as an abstract class)

- We can never create a 'post' object
  - We cannot instantiate one because Post is abstract.

- In Post, we define fields and methods that can be used later for all subclasses (using super)
  - e.g. display(), constructor.

Syntax for abstract classes

```java
public abstract class Post
{
    private String username;  // username of the post's author
    private long timestamp;
    private int likes;
    private ArrayList<String> comments;
```

displayExcerpt() as an abstract method

- If you wish all subclasses of a class to implement a particular method as part of its code, simply write an abstract method heading in superclass.

- Each subclass <u>must</u> have this method fully coded OR the class must be declared as abstract.

displayExcerpt() as an abstract method

```
abstract String displayExtract();
```

Post

```java
/**
 * return a short extract of the post message
 * @return A string containing the first 10 chars of the post
 */
String displayExtract()
{
    return "Message extract "+ message.substring(0,10) + "....";
}
```

MessagePost

```java
/**
 * return a short extract of the photo caption
 * @return A string containing the first 10 chars of the caption
 */
String displayExtract()
{
    return "Photo caption: " + caption.substring(0,10) + "....";
}
```
